V DD and V SS are carryovers from conventional MOS circuits and stand for the drain and source supplies. These do not apply directly to CMOS, since both supplies are really source supplies.

Table 1 : Booth recoding strategy for each of the possible block values. Since we use the LSB of each block to know what the sign bit was in the previous block, and there are never any negative products before the least significant block, the LSB of the first block is always assumed to be 0.
